

DAY 8: Tuple and set

→ Tuple is collection of different datatypes that separated by , and represented by ()

→ it is immutable

→ we can pass a tuple of values and that can be assign to the variables, but should match same number variables and values inside the tuple

indexing→

Eg:

```
t=(1,'python',[3,4],(7,9))  
print(t[3][1])
```

index()

→ if the item is not present in the tuple , it will raise ValueError

eg:

```
t=(1,'python',[3,4],(7,9))  
print(t.index('Python'))
```

len ()→

```
t=(1,'python',[3,4],(7,9))  
print(len(t))
```

note: we can pass a tuple of values and that can be assign to the variables, but should match same number variables and values inside the tuple

```
name,age,batch=('praveen',20,6)  
print(name,age,batch)
```

max→

It is used to find out the max value from the tuple

Eg:

```
so =(1,2,4,6,89,99,50)  
print(max(so))
```

min→

It is used to find out the least value from the tuple

Eg:

```
so =(1,2,4,6,89,99,50)
print(min(so))
```

count→

It is used to count an item present in the tuple

Eg:

```
so =(1,1,3,89,99,50,88)
print(so.count(88))
```
