

DAY 5: Bitwise operator & input and output formatting

This operator that tells the computer what operation to perform, bit by bit on values or variables

(&) → bitwise and

```
print(5&3)
```

(|) → bitwise or

```
print(5|3)
```

(^) → bitwise xor

```
print( 5 ^ 3)
```

(> >) → right shift

```
print(5 >> 2)
```

(< <) → left shift

```
print(5<<1)
```

Input formatting

integer → `int( input( ) )`

```
num =int(input('enter a number:'))
```

```
print(num+20)
```

float → `float(input ( ) )`

```
b=float(input('enter any float value:'))
```

```
print(b+20)
```

string →

```
name=input('enter your name:')
```

```
print(type(name))
```

```
list→ list(map(int, input ().split ()))  
nums =list(map(int,input('enter some numbers:').split( ) ))  
print(nums)  
  
tuple→ tuple(map(int, input().split ( ) ))  
nums =tuple(map(int, input('enter some number:').split()))  
print(nums)  
  
set→ set(map(int,input().split ( ) ))  
nums=set(map(int,input().split()))  
print(nums)
```

Output formatting

```
name='praveen'  
age =20  
print('my name is',name, 'my age',age)  
print('hello',name)  
  
f string→  
name='praveen'  
age=20  
print(f'my name is {name} my age {age}')
```

% →

```
name='praveen'  
age=20  
print('my name is %s and im %d years old'%(name,age))
```
