

# DAY 21: Exception & file handling

```
'''
Exception Handling
-----
--> This is the way of handing error
--> we can write any number of exceptions for one code written
at try block..

try
----
--> The try block, where we can write code which may contain error
syntax -->
try:
    code lines
except
----
--> This will handle error that are raised at try block

syntax -->
except errorname:
    print('errorname')

eg:
try:
    print(5/0)
    print(num)
except ZeroDivisionError:
    print('Division by zero')
except NameError:
    print('Name Error')
```

```

else
-----
--> The else block will only executr, if no error at try bl
ock
Eg:
try:
    print('hello world')
except ZeroDivisionError:
    print('Division by zero')
except NameError:
    print('Name Error')
else:
    print('no error')

```

```

finally
-----
--> This block will execute regardless with the error at tr
y block
try:
    print(num)
except ZeroDivisionError:
    print('Division by zero')
except NameError:
    print('Name Error')
else:
    print('no error')
finally:
    print('end')

```

```

file handling
-----
--> Thr file handler is a object, which is used to create,u
pdate
read and delete...
modes
---
```

r--> the (r) mode is used when read() function is used.  
w--> the (w) mode is used when write() function is used.  
a--> the (a) mode is used when append() function is used.  
x--> the(x) mode is used when want to create a new file

functions

-----

read()

write()

append()

'''

with open('dem.txt','x') as file:

print(file.write('this is praveen'))
